

Sprint 5 Reflection

Overview

This last sprint was focused entirely on honing our ideas and finalizing our deliverables.

Work included:

- Advanced physics implementations:
 - Slide
 - Bounce
 - Slow
 - General terrain and biome generation:
 - Forest
 - Swamp
 - Mountain
 - Sky island
 - Graphical deliverables:
 - Blocks
 - Player
 - Projectiles
 - General debugging:
 - Fixing major stage issues
 - Fixing physics issues
-

Burndown Chart Analysis

The burndown chart would show:

- A **slow, steady base of work** done for short periods in the early days of the sprint
- This reflects that most of the physics deliverables were developed over the past week

It would also show:

- A **massive spike at the end**
 - This occurred as we made sure everything that we meant for our deliverables was ready
-

Team Strengths

Our best strength as a team has always been:

- Our ability to **communicate outside of class time over Discord**

This helped us:

- Create better workflows
 - Prevent issues with:
 - Pushing content
 - Pulling content from Git
-

Areas for Improvement

- The burndown chart shows a **heavy spike at the end**, meaning work was not evenly distributed
 - There was a **cram and rush for deliverables**, especially toward the end
-

Future Improvements

In future sprints, we would:

- Hope to **even out the burndown chart**
- Avoid:
 - Large spikes in work
 - Last-minute rushing
- Improve pacing, especially during:
 - The beginning of finals season
