

Sean

Justin

Benny

TODO:

- Fix collision bugs
- Level generation
- Player damage system
- Void system
- Implement momentum collisions
 - Projectile - player
 - Projectile - enemy
- Camera movement?
 - Probably only if arcade mode is continuous

SPRINT 3 requirements

- Levels
 - For requirement, different rooms can spawn with only grass or only apple
 - For testing, Some way to quickly cycle through levels (it suggests mouse clicking or something maybe we do right click)
 - For testing, one room should have every object
- Different items (implement other plant species)
 - As our plants become different, add a test method to shoot out a plant of each type
- not code stuff (boring)
 - Code reviews
 - > 2 files for A
 - Readme
 - If just updated it should be fine
 - Reflection
 - Analytics?
 - From someone with purple VS
 - Task tracking
 - Sharing this doc and stating somewhere (he said readme) that we communicated heavily over discord.

- BENNY - seed collision and planting
 - In the future, make this detect the first block it collided with and seed itself in the center.
 - I think it could be cool to change the species depending on what it hits the angle it hits, like if it hits a stone floor it turns into moss but if it hits another vertical plant it turns into like an epiphyte fern (Like the purple one in starseed)
- JUSTIN - abstracting projectiles
- JUSTIN - "Void Spawn" creature
- ADVAIT - fix readme
- Pretty stuff:
 - SFX
 - Music
 - Sprites
 - Void particles
 - Blocks
 - player
- Also organizational stuff:
 - More state machine classes
 - Rigidbody class
 - Create interfaces for each class
 - Split up interfaces
 - Split up Util
 - More subdirs and better names
 - general consistency between classes
 - is there redundancy in colliding with floor logic?
 - make distinction between Player and Linksprite and make the latter a proper state machine
- non-code stuff:
 - calculate code metrics or code analyzers (look at sprint2 for more info)
 - each person needs to know how at least one class works
 - brief report on how sprint2 went

Future Sprints

- inventory
- health?
- planting seeds timing/general mechanics
- Levels
 - create level class
 - create way for initial data to be stored
 - way to progress from one to the next

Misc notes

- Inspo games
 - Spleefunky / Noita
 - Antichamber
 - AAAAXY (perhaps VVVVVV too?)
 - n step steve
 - Starseed pilgrim
 - Fez
 - Kodachrome (by Mr. No Wind Studios, lampshade by him is also pretty cool)
- since we probably won't have npcs/enemies, we need more complexity or content elsewhere. We're free to customize it to our game as much as we want as long as we're doing roughly the same amount of work as if we were doing the Link game
- Sean game for gamejam as a template for how things can work:
 - <https://globalgamejam.org/games/2026/bit-bucket-0>
- game analysis thingie (spoilers) <http://starseedobservatory.com/home.html>
- blind (i think) playthrough playlist:
https://www.youtube.com/watch?v=3cyRRp-tH1c&list=PLxhFHMWUIwc8_XnSMg5NXkIOyB-7UBDf4&index=1

If you did all your stuff for sprint 2 you can work on stuff for future sprints

This color = optional for now

OLD Sprint2 TODO

- ~~JUSTIN - obstacles/platforms~~
- ~~JUSTIN - collisions~~
- SEAN - ~~being able to toggle through item sprites (seeds)~~
 - collating plant growth logic from Advait's class and finding a nice way to implement all different growth patterns while reusing as much code as possible
- ~~BENNY - Mouse controller (already exists so prob just get pos and maybe bind a command to mouse.click)~~
 - On the fence about this, but an NPC class that eventually will be hit with seeds
- JUSTIN - along with above, projectile system for player to shoot projectiles. ~~Have some indication the direction the player is aiming, and on click fire a projectile (can use temp sprite)~~
 - In the future, make this detect the first block it collided with and seed itself in the center.
 - I think it could be cool to change the species depending on what it hits the angle it hits, like if it hits a stone floor it turns into moss but if it hits another vertical plant it turns into like an epiphyte fern (Like the purple one in starseed)
- ~~ADVAIT - plant interface, abstract class, and (at least one) specific instance. Should work enough to show an animation going through a few states.~~
- ADVAIT - update readme & anything else I missed from the rubric
- AIDEN - stealing sprites (~~plant blocks, player sprites~~, void, projectiles if player will shoot them, other particles (like void particles))
